“What was that Sound?”

Abstract: Mr. Bjørnar Lingjerde, Biota Guard

Online health measures of snow crabs during seismic exposure

The project activities and results of the study “Effects of Seismic on Snow crab” which Biota Guard performed in cooperation with OERA will be presented along with Biota Guards offshore oil leak detection technology and service.

Using a large animal like the snow crab (*Chionoecetes opilio*) as a biosensor requires understanding of both technology and biology, and the method of data collection and interpretation are among the central elements which will be covered in this presentation.
